Jumper Networks Releases the New Jumper 2.0 Platform

PLYMOUTH, MA (March 25, 2009) – Jumper Networks today announced plans to release source code for Jumper 2.0™ as open source. This initiative will let developers worldwide participate in the growth of the industry's most innovative framework for Universal Search powered by Enterprise bookmarking. The open source Jumper 2.0 documentation will be available under the General Public License version 2 (GPLv2).

Available since September 2008, the free Jumper 2.0 includes the technologies developers need to build effective Knowledge tagging and Hyperdata capabilities that make up the popular Jumper platform. "Open source co-creation is a powerful way to build a strong development community," said Hugh King, Executive Vice President of Worldwide Sales. "We are excited to release our work as open source on Sourceforge and believe it will attract a new class of developer to the platform."

Using the GPL for open sourcing Jumper will allow full and free access to source code. Developers will be able to freely download, extend, and contribute to the source code for the Jumper scripts and application framework. Jumper Networks will continue to provide enterprise class support and services for the Jumper 2.0 platform for both new and existing partners and customers to choose the support that best suits their requirements.

"The definition and evolution of Jumper has been influenced by our incredibly talented developer community from day one," said Steve Perry, Founder and Lead Architect at Jumper. "The decision to open source Jumper was a completely natural next step. I am incredibly excited to deeply collaborate with the developer community on Jumper 2.0, and further fuel its momentum and innovation."

For more information on the terms of the GPL and how to contribute to the open source please visit our project on sourceforge. <http://sourceforge.net/projects/jumper>

About Jumper Networks

Jumper is an innovative Enterprise 2.0 software company. Our focus provides research organizations with a universal search solution for the legal, product, and biomedical research areas.

Our mission is to revolutionize search. The reliance on data as the primary conduit of knowledge creates mountains of raw information with few plausible means of searching, filtering, extrapolating, and internalizing for future knowledgeable decisions or analysis in a relatively timely manner. In essence, the data resources are widely distributed in silos and difficult to

discover, and the knowledge found in one's head is lost to the system of search rather than being an asset for the current researcher.

We are committed to delivering innovative and high quality technology and services that empower our customers to turn the ever increasing volumes of data into new insights, efficiencies, and opportunities. Our goal is to provide your employees with the tools they need to share the collective knowledge that exists across your organization.
