Jumper Networks Releases the New Jumper 2.0 Platform

PLYMOUTH, MA (Sept 29, 2008) – Jumper Networks, an innovative startup pioneering Web 2.0 knowledge management technology, today announced the release of Jumper 2.0. Jumper provides a universal search capability by leveraging an expanded social bookmarking technique to capture knowledge. The software represents a fundamentally new approach to managing data using a Web 2.0 front-end where user-created data profiles identify quality data resources, user contributed information adds real-world knowledge about the data resources, and user-created reviews sort out the worthy resources from the inadequate. Knowledge tags capture conceptual and expectational knowledge, as well as tacit and anecdotal knowledge with the data resource itself.

Jumper 2.0 provides a web-infrastructure to search and access diverse and distributed resources, including file systems, databases, and archival storage. At the center of Jumper 2.0, are user created tag profiles that create a reference to data stored remotely regardless of format, schema, or vendor. Jumper 2.0 enables productive collaboration and efficient knowledge exchange within a secure, scalable, easily administered environment.

According to Steve Perry, Founder and Chief Architect of Jumper, “As data volumes continue to grow managing this data is becoming increasingly problematic. The mission of our software development team is to continue to give end-users in data-rich environments the easiest and most efficient way to search and share their data and knowledge.”

Jumper Networks can accelerate demanding research and development projects, facilitate organizational integration and collaboration, and positively impact research and business outcome by optimizing data search and repurposing.

About Jumper Networks

Jumper is an innovative Enterprise 2.0 software company. Our focus provides research organizations with a universal search solution for the legal, product, and biomedical research areas.

Our mission is to revolutionize search. The reliance on data as the primary conduit of knowledge creates mountains of raw information with few plausible means of searching, filtering, extrapolating, and internalizing for future knowledgeable decisions or analysis in a relatively timely manner. In essence, the data resources are widely distributed in silos and difficult to discover, and the knowledge found in one's head is lost to the system of search rather than being an asset for the current researcher.

We are committed to delivering innovative and high quality technology and services that empower our customers to turn the ever increasing volumes of data into new insights, efficiencies, and opportunities. Our goal is to provide your employees with the tools they need to share the collective knowledge that exists across your organization.
